# Report Name: Fresh Deciduous Fruit Annual 

Country: Korea - Republic of
Post: Seoul
Report Category: Fresh Deciduous Fruit

Prepared By: Sunyoung Choi, Tymothy Mcguire
Approved By: Ronald Verdonk

## Report Highlights:

In marketing year 2019/20, Korea's pear production is projected to increase by 3.4 percent to 210,000 metric tons due to increased yield as a result of better weather conditions compared to the previous year. However, pear planted area is projected to continue a downward trend, decreasing about seven percent to 9,625 hectares from the previous marketing year. This will be the Korean pear industry's first time ever below 10,000 hectares, with pears becoming increasingly less attractive to producers as consumer demand declines and alternative crops appear more profitable. Korea's pear exports are projected to rebound by 7.3 percent (about 2,000 metric tons) to 29,000 metric tons from the previous year because of the increasing popularity of Korean culture and products in Southeast Asian countries.

## Planted Area

In marketing year (MY) 2019/20 (July-June), Korea's pear planted area is projected to decrease about seven percent to 9,625 hectares (ha) from the previous marketing year. As FAS Seoul reported in previous GAIN reports, Korea's pear planted area has steadily decreased due to the following trends:

1) Rapid aging of the farming population
2) Rapid urbanization of pear farming areas surrounding cities, and
3) Farmers shifting to more profitable and less labor-intensive crops.

It is also estimated that a reduction of area planted to pears will continue in coming years as producers remove old trees, coupled with slower planting of new trees for traditional pear varieties. Meanwhile, new planted area for new varieties of young trees is expected to increase gradually, but this will not reverse the current ongoing trend of declining planted area.

Source: Ministry of Food, Agriculture and Rural Affairs (MAFRA)

Korea's pear production area has decreased significantly, by 63 percent, during the past two decades after reaching a record in MY 2000/01 of 25,719 hectares. In particular, the area for mature trees for fruit production has decreased an average of two percent annually, while the area for new planting (young trees) has decreased drastically by 16 percent annually. In MY 2018/19, total planted area decreased by five percent to 10,303 hectares from the previous marketing year. Pear trees can bear commercial fruit in six to seven years after planting. Korea's pear growing area is relatively evenly spread across four main provinces of South Jeolla, Chungcheong, Gyeonggi and Gyeongsang, each contributing around 20 percent of overall production. The balance is spread across the rest of the country.

## Production

In MY 2019/20, FAS Seoul projects Korea's pear production to increase about 3.4 percent ( $6,834 \mathrm{MT}$ ) to 210,000 MT from the previous marketing year despite 6.7 percent lower planted area than the previous year. The production increase is mainly due to an 11 percent higher yield as a result of favorable weather conditions during the fruit growing period. However, the ratio of high quality fruit production and marketable fruits is estimated to be lower than the previous year because of typhoon damage right after Chuseok (the Korean Thanksgiving Day) holidays in September and early October and a greater percentage of malformed fruits caused by colder weather during the last flowering period in spring.

Korea's pear production peaked at 470,000 MT in MY 2007/2008 along with the increased ratio of fruit bearing (mature for commercial production) trees in planted area. Subsequently, pear production fell an average of eight percent annually between 2008/9 and 2017/18. In MY 2018/19, Korea's pear production decreased by 24 percent to 203,000 MT due mainly to reduced yield (fruit bearing per tree) caused by exceptionally unfavorable weather throughout the year, especially colder weather in the early spring flowering season and a severe drought and heat wave during the fruit growing period in summer.

Source: Ministry of Food, Agriculture and Rural Affairs (MAFRA) \& Statistics Korea
In MY 2018/19, Korea's pear industry mostly produced a single variety known as Singo (also known as Asian pear or sand pear), representing 86 percent ( $8,902 \mathrm{ha}$ ) of total pear planted area ( $10,303 \mathrm{ha}$ ). The rest of production was covered by other varieties: Wonhwang (five percent) and a handful of minor pear types (nine percent). Although the government's Rural Development Administration research center and pear growers have steadily introduced new pear varieties to meet consumer demand, pear growers still mainly produce the Singo cultivar due to its higher quality, larger size, and longer shelf life. As result of the relatively strong consumer demand for Singo pear and the time needed to introduce new varieties (about six to seven years to get commercial production after tree planting), Korean pear growers remain reluctant to try new pear cultivars.

## Consumption

In MY 2019/20, Korea's fresh pear consumption is projected to increase about 2.3 percent to 175,000 MT due to increased pear supply caused by about 11 percent higher yield and expected lower market prices (consumer price and wholesale price) from the previous year. However, many Korean consumers purchase pears mostly for traditional holidays or for ancestral rite day, with half of all consumption falling on the two primary traditional holidays: Chuseok and the Lunar New Year. Additionally, fresh pear demand has decreased gradually in recent years due to a declining trend of families participating in the ancestral rite culture and a strict enforcement of an anti-bribery act in recent years, reducing the demand for gift-giving as well. Moreover, pear demand in general has declined as an increasing number of alternative fruits, including various imported fruits, have become available to consumers.

| Korea's Average Annual Market Prices (Consumer \& Wholesale) for Fresh Pears (Unit: KRW, Percent) |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Marketing Year (July - June) | Average Annual Consumer Price (KRW/10 fruits) | Change (\%) | Average Annual Wholesale Price (KRW/15KG) | Change (\%) |
| MY2016/17 | 31,703 | - | 43,125 | - |
| MY2017/18 | 29,889 | -6 | 40,848 | -5 |
| MY2018/19 | 35,539 | 19 | 46,714 | 14 |

Source: Korea Agro-Fisheries \& Food Trade Corporation (aT)
As a result of reduced pear production in MY 2018/19, the consumer and wholesale market prices increased by 19 percent (KRW 35,539/10 fruits) and 14 percent (KRW 46,714/15kg) respectively from the previous annual average market prices (KRW 29,889/10 fruits \& KRW 40,848/15kg).

Korea's per capita pear consumption, which reached a peak of 9.2 kg in 2008 , has gradually decreased to around 4 kg in recent years due to the aforementioned trends. In 2018, it decreased again by 1.3 kg to 3.3 kg from the previous year because of reduced consumer demand and declining pear supply caused by lower production.

In recent years, changing consumption patterns toward easier and smaller size fruits resulting from an increasing percentage of single-member households led to an even faster decline in demand for fresh pears. Many singlemember households struggle with the consumption of the large-sized pears as they are less convenient to eat than other fruits.

For Processing
The Korean pear industry uses 5,000 to 10,000 MT of fresh pears for processing annually, mainly for pear juice products. Fresh pears for processing are mostly non-marketable fruits with damage occurring during production, such as scratches caused by strong wind or typhoon, or malformed fruit caused by cold weather and drought, etc. In MY 2019/20, out of overall production, about 6,000 MT of fresh pears will be used for processing. As a result of reduced demand caused by shrinking consumer sentiment this year, the Korea’s Ministry of Agriculture, Food and Rural Affairs plans to purchase about 5,000 MT of late variety pears (mostly Singo pears) by the end of December 2019 to support pear growers. Government- purchased fresh pears will not enter the commercial fresh fruit market and will be used for processing only.

## Trade

Import - To date, no fresh pear imports are allowed under Korea's phytosanitary regulations.
Export
In MY 2019/20, Korea's fresh pear exports are projected to increase to 29,000 MT, up about 7.3 percent from the previous year ( 27,029 MT) due to increased domestic production and the popularity of Korean culture and products in the Southeast Asian markets, principally Taiwan, Vietnam and Hong Kong. Generally, Korea exports about 10 to 15 percent of total pear production. In MY 2018/19, Korea's pear exports decreased by 14.6 percent to 27,029 MT from 31,657 MT in MY 2017/18 mainly due to the reduced production caused by unfavorable weather throughout the year. The United States was still the top export market for Korean fresh pears in MY 2018/19 (driven by Korean-American consumers), covering 42 percent share and followed by Vietnam ( 25 percent) and Taiwan ( 25 percent), respectively.

As a result of reduced production of quality fruit caused by unfavorable weather in MY 2018/19, fresh pear exports to Taiwan decreased by 31 percent ( $2,973 \mathrm{MT}$ ) to $6,740 \mathrm{MT}$ from the previous year, while Korean pear exports to Vietnam were 6,779 MT. The United States remains the top export market for Korean pears, followed by Vietnam. Korea's fresh pear exports to Vietnam have increased rapidly in recent years from 1,313 MT in MY 2015/16 to 7,741 MT in MY 2017/18 over the past four years. This is a reflection of the popularity of Korean culture and Vietnam's relatively less restrictive quarantine requirements compared to other major importing countries like the United States and Taiwan.
