# Fresh Apples, Grapes, and Pears: World Markets and Trade 

## FRESH APPLES

World production for 2019/20 is forecast up nearly 5.0 million metric tons (tons) to 75.7 million, as rebounding production in China more than offsets sharply lower production in the European Union. Higher world trade is expected as a result of China's improved supplies.

China's production is forecast to rebound 8.0 million tons to 41.0 million, regaining all of last year's lost output from severe weather. Nearly all major growing provinces experienced favorable growing conditions throughout fruit development, and higher supplies are expected to boost exports up 230,000 tons to over 1.0 million. Though domestic supplies are higher, quality is reported as only fair, increasing import demand for higher quality apples to a record 100,000 tons.

EU production is slated to drop nearly 25 percent to 11.5 million tons as the majority of Member States, especially Poland, experienced a combination of frost, drought, heat, and hail. This will mark the second time in 3 years that weather-induced losses will lower production more than 20 percent. With reduced output, exports are forecast down 200,000 tons to 975,000 , the secondlowest level since 2007/08. Imports are expected to remain nearly unchanged at 500,000 tons as a smaller share of domestic output goes towards processing and greater supplies are diverted to fresh consumption.
U.S. production is projected to rise 179,000 tons to 4.7 million on improved output in Washington resulting from favorable summer weather. USDA's
National Agricultural Statistics Service (NASS) surveyed industry and published a U.S. forecast for apple To receive the circular via email, register at: https://public.govdelivery.com/accounts/USDAFAS/subscriber/new
production in the August 2019 Crop Production report*. Greater supplies and the removal of Mexico's 20-percent retaliatory tariff in May 2019 are expected to boost exports over 100,000 tons to 860,000 . Imports are forecast to remain nearly unchanged at 145,000 tons as higher shipments from New Zealand offset lower shipments from Chile.

* Note: As of the 2018/19 marketing year, the number of U.S. states surveyed was reduced from 20 states to 7. The 13 eliminated states accounted for 5-6 percent of production in the 20017/18 marketing year. U.S. production is now based on surveys from only the following states: California, Michigan, New York, Oregon, Pennsylvania, Virginia, and Washington.

Turkey's production is expected to remain at last year's record 3.0 million tons on a mild winter and good conditions during flowering and fruit development. Despite greater supplies, exports are forecast to ease 17,000 tons to 260,000 on weaker demand from Middle East markets.

India's production is forecast flat at 2.4 million tons as late monsoon rains inhibited higher output. Imports are projected 27,000 tons lower to 250,000 reflecting the ongoing ban on apples from China and the continued retaliatory tariff on U.S. supplies.

Russia's production is forecast to rise over 100,000 tons to a record 1.7 million, a second straight record year as new orchards come into production and yields improve. The government continues to assist the industry through various support mechanisms including assistance for planting new orchards and orchard care as well as low-interest loans and partial reimbursements of capital expenses for construction of cold storage facilities. The Ministry of Agriculture is forecasting cold storage capacity to rise from 670,000 tons in 2019 to 1.6 million by 2025. Greater quantities and improved quality of domestic supplies are expected to ease demand for imports, declining 80,000 tons to 710,000 . Nonetheless, Russia still retains its position as the world's top apple importer

Chile's production is projected down 86,000 tons to 1.1 million due to drought and decreasing planting area. This will mark the sixth straight year of declining acreage as growers switch to more profitable crops such as cherries and tree nuts. Exports are forecast down 45,000 tons to 660,000 on reduced supplies with shipments expected to shift more towards India and Asian markets.

South Africa's production is anticipated to return to previous levels, bumping up 50,000 tons to 910,000 on normal winter rainfall, improved water management practices, and new plantings coming into production. Quality is also expected to improve as a result of good moisture, and, combined with higher output, is forecast to drive exports up nearly 20 percent to a record 570,000 tons.

Mexico's production is expected to rebound over 130,000 tons to 680,000 as new trees come into production and good growing conditions lead to higher yield. The top growing state of Chihuahua has seen significant growth the last 10 years due to investment in new high-density orchards and slowly expanding planting area. The removal of the 20-percent retaliatory tariff on U.S. supplies in May 2019 is expected to boost imports over 30,000 tons to 280,000 .

New Zealand's production is projected up for a third straight year, rising over 20,000 tons to 600,000 as trees from expanded planting area come into production. Planting area is expected to continue its rise, though at a slower pace. To raise output, growers are increasingly turning towards reinvesting in existing orchards, replacing older varieties and undertaking higher-density plantings. Higher supplies are expected to boost exports 15,000 tons to 405,000 with more shipments going towards Asian markets.

Argentina's production is forecast flat at 550,000 tons as good growing conditions and new higher-yield orchards offset losses stemming from the continued decline in planting area. Growers continue to face challenges that threaten the long-term viability of the industry as rising input costs and lack of available resources hinder even basic orchard health practices. In line with production, exports are expected to remain unchanged at 90,000 tons.

Key Revisions to 2018/19:

| Country | Attribute | Previous | Current | Change | Reason |
| :--- | :--- | ---: | ---: | ---: | :--- | :--- |
| China | Production | 31,000 | 33,000 | 2,000 | revised data |
|  | Exports | 880 | 818 | -62 | lower shipments to Southeast Asian markets |
| European Union | Production | 14,009 | 15,030 | 1,022 | higher-than-expected production |
|  | Imports | 470 | 493 | 23 | higher shipments from Chile and New Zealand |
| India | Imports | 245 | 277 | 32 | higher shipments from the European Union |
| Iran | Production | 2,799 | 2,097 | -703 | updated FAO data |
| Jordan | Imports | 0 | 54 | 54 | new country added to PSD, data has been added going back <br> to 2001/02 |
| Moldova | Exports | 0 | 297 | 297 | new country added to PSD, data has been added going back <br> to 2001/02 |
| South Africa | Exports | 540 | 480 | -60 | lower-than-expected shipments to the European Union and <br> countries in Africa |
| United States | Production | 5,048 | 4,486 | -562 | Washington reported very challenging fire blight, less fruit on <br> trees than initially appeared |
| *Note: All figures are in thousand metric tons. |  |  |  |  |  |

## FRESH TABLE GRAPES

World production for 2019/20 is expected to rise 4 percent to 23.4 million tons as gains in China and India more than offset losses in the European Union resulting from heavy rains. Higher supplies are forecast to boost exports slightly while imports are also projected up on higher shipments to the United States.

China's production is projected to rebound from last year's frost-damaged crop, rising 900,000 tons to 10.8 million. Greater supplies are expected to spur exports up 30,000 tons to 320,000 , especially to Thailand and Vietnam. Imports are forecast slightly lower to 250,000 tons as improved domestic supplies lower import demand. Ironically, Spain and Portugal recently gained market access in China; Spain is the European Union's second-largest table grape producer. The United States is currently China's leading Northern Hemisphere supplier.

India's production is forecast up 200,000 tons to a record 3.0 million, though this is lower than initially expected. Heavy rains in September and October in northern Maharashtra are causing losses, affecting yield and quality. With fewer export-quality supplies, exports are expected to slip 27,000 tons to 220,000 .

Turkey's production is expected to rise slightly to 2.0 million tons despite reports of hail damage in parts of the Aegean Region. Exports are expected to remain unchanged at 180,000 tons as a lack of newer consumer-preferred varieties limits foreign demand.

EU production is forecast to drop 220,000 tons to 1.4 million as heavy rains during flowering caused significant losses in Italy, the top growing Member State. Despite lower supplies, demand is expected to keep imports at last year's level of 690,000 tons, while exports are forecast flat at 78,000 tons. Diminished output coupled with sluggish demand is anticipated to reduce domestic consumption to 2.0 million tons, the lowest since at least 2001/02 (the earliest year in the PSD database).
U.S. production is expected to remain steady at 998,000 on good growing conditions. USDA's National Agricultural Statistics Service surveyed industry and published a U.S. forecast for grape production in the August 2019 Crop Production report. Exports are forecast down 23,000 tons to 345,000 on lower demand from Mexico, while imports are projected up to a record 645,000 tons on record June shipments from Mexico in the beginning of the marketing year. Large quantities of high-quality domestic supplies are expected to underpin the rising trend in domestic consumption.

Record U.S. Table Grape Imports Forecast on Surging Mexico June Shipments

Peru's production is forecast up 18,000 tons to 648,000 on good growing conditions and new plantings coming into production as planting area continues to expand. In line with production, exports are projected up 16,000 tons to 400,000 , with the majority of shipments going to the United States.

Chile's production is expected to ease 26,000 tons to 809,000 as drought affects output in top growing regions Valparaiso and O'Higgins. Planting area is on a slow downward trend, however, growers are transitioning to consumer-preferred seedless varieties in an effort to better serve markets and stay competitive. Exports are forecast down 20,000 tons to 640,000 on lower supplies but also declining demand for older varieties still being grown.

Russia's production is forecast flat at 21,000 tons on unchanging planting area as land suitable for grapes is more likely to go towards wine grape varieties. Imports are projected down 10,000 tons to 280,000 on lower shipments from top supplier Turkey and as consumers shift to less expensive fruit during the winter season.

South Africa's production is projected to rise 12,000 tons to 310,000 on good growing conditions, sufficient water, and increased harvest area, some of which has been converted from wine grapes. Greater supplies and higher demand in Asian markets are expected to give a slight boost to exports, up 10,000 tons to 285,000 .

Australia's production is projected up 30,000 tons to 240,000 on new plantings coming into production, making this the eighth year of growth in the last 10 years. Though conditions are dry, attractive returns are anticipated to help offset higher water costs. The growth trend in production is expected to continue as vine plantings increase in response to strong demand from Asian markets. Higher supplies are expected to boost exports 20 percent to 175,000 tons. Over the last 5 years, Australia has normally exported over 60 percent of its production each year.

Key Revisions to 2018/19:

| Country | Attribute | Previous | Current | Change | Reason |
| :--- | :--- | ---: | ---: | ---: | :--- |
| China | Production | 9,450 | 9,900 | 450 | revised official data |
| Mexico | Imports | 102 | 127 | 25 | higher-than-expected imports from the United States |
| Australia | Exports | 115 | 146 | 31 | higher-than-expected shipments to China and Indonesia |
| Hong Kong | Exports | 210 | 226 | 16 | higher shipments to China |
| India | Exports | 205 | 247 | 42 | higher shipments to the European Union |

*Note: All figures are in thousand metric tons.

## FRESH PEARS

World production for 2019/20 is forecast up 13 percent to a record 23.1 million tons as gains in China more than offset weatherinduced losses in the European Union. Higher output in China is expected to boost global trade.

China's production is projected to rebound from last years' frost-damaged crop, surging over 20 percent to 17.0 million tons on favorable weather. Improved supplies are forecast to drive exports up almost 40 percent to 500,000 tons on higher shipments, especially to Indonesia and Vietnam. Imports, though small, are also forecast up, rising to 15,000 tons as successful EU marketing campaigns rouse interest in Western pear varieties.

EU production is forecast down over 400,000 tons to 2.2 million as nearly all Member States experienced crop-damaging weather. Exports are expected to plummet nearly 30 percent to 220,000 tons on reduced output, while the lower supplies are expected to boost import demand by 12,000 tons to 180,000 .
U.S. production is unchanged at 726,000 tons as higher yield in California on good weather conditions offsets losses in Washington resulting from fire blight disease, hail, and heavy rain. USDA's National Agricultural Statistics Service surveyed industry and published a U.S. forecast for pear production in the August 2019 Crop Production report. Exports are expected up slightly to 150,000 tons on improved deliveries to top markets, including Mexico, Canada, and India. Higher shipments from China and South Korea are expected to help lift imports, forecast up 7,500 tons to 80,000 .

Argentina's production is forecast unchanged at 590,000 tons on normal weather conditions. The industry continues to struggle with rising input costs and lack of investment. Exports are also expected to remain steady at 300,000 tons on sustained demand from Northern Hemisphere markets.

Chile's production is expected to see a drop of 25,000 tons to 227,000 , a third straight year of reduced output as drought lowers yield and planted area continues to decline. Shrinking supplies are expected to lower exports 13,000 tons to 117,000 , its lowest level since 2013/14.

South Africa's production is projected up slightly to 415,000 tons on normal winter rainfall and new plantings coming into production. With nearly 60 percent of production exported on average, higher supplies are expected to raise exports 5,000 tons to 245,000 .

Russia's production is forecast slightly higher to 245,000 tons on improved output in non-commercial, or house-hold, orchards. Imports are expected to ease again, down to 253,000 tons, as consumers continue to lean towards less expensive fruit. However, Russia remains the world's top pear importer.

Key Revisions to 2018/19:

| Country | Attribute | Previous | Current | Change | Reason |
| :--- | :--- | ---: | ---: | ---: | :--- |
| China | Production | 13,100 | 14,000 | 900 | revised official data |
|  | Exports | 390 | 366 | -24 | lower shipments to Southeast Asia markets |
| European Union | Imports | 200 | 168 | -32 | lower shipments from Chile and South Africa |
| Indonesia | Imports | 165 | 145 | -20 | lower than anticipated shipments from China |

*Note: All figures are in thousand metric tons.

## Marketing Years:

Apples - The United States and Mexico are on an August-July marketing year. All other Northern Hemisphere countries are on a July-June marketing year. Southern Hemisphere countries are on a calendar year indicated as the second year of the split year.

Table Grapes - The United States and Mexico are on a May-April marketing year. All other Northern Hemisphere countries are on a June-May marketing year. The Southern Hemisphere countries of Argentina, Australia, Chile, Peru, and South Africa are on an October-September marketing year. Brazil is on a calendar year indicated as the second year of the split year.

Pears - Northern Hemisphere countries are on a July-June marketing year. Southern Hemisphere countries are on a calendar year indicated as the second year of the split year.

Note: The United States and Mexico are on a May-April marketing year. All other Northern Hemisphere countries are on a June-May marketing year. Southern Hemisphere producer countries of Argentina, Australia, Chile, Peru, and South Africa are on an October-September marketing year, and Brazil is on a calendar year indicated as the second year of the split year. Some countries may include raisin-type and/or table-type grapes.
